

Prescription

This course details how embedded controllers can be used to solve a number of real-world engineering problems. The main emphasis is on 8-bit microprocessors, logic systems to support them and techniques to interface them with the physical world. Specific topics include microcontrollers, sensors, actuators, signal conditioning, filters, analogue to digital conversion, systems analysis and introductory control. Practical experience is gained through the use of programming a microcontroller in a high level language and interfacing it to real-world systems.

Course learning objectives

Students who pass this course will be able to:

1. Be skilled in the high-level use of a microcontroller to solve a variety of real-world problems. (3b)
2. Understand the advantages and disadvantages of a range of different sensors, signal conditioning and signal processing elements of an embedded control system and be able to select the option best suited for a variety of engineering applications. (3b) (3e)
3. Be familiar with the physical principles of analogue to digital conversion and sampling theorems. From a knowledge of the advantages and disadvantages of a variety of ADC techniques, the student will be able to select the appropriate device for a range of engineering applications. (3b)
4. Have a basic understanding of the embedded Linux operating system. Understand the advantages and disadvantages of bare metal programming versus using an embedded operating system. The student should be able to interface sensors/actuators to an embedded operating system. (3b)
5. Understand and be able to apply the concepts of transfer functions and Bode Approximations in order to predict the behaviour of a simple system. (3a) (3c)
6. Have a basic understanding of classical PID control theory and Fuzzy logic. (3b). The student will be able to apply a simple PID system to the speed control of a DC motor.
7. Be able to effectively communicate in a written manner the methodology, design compromises, results and evaluation of a variety of microcontroller based solutions to real-world problems. 2(b) 3(f)

Course content

In 2021, it will be possible to take this course remotely, and distance-based versions of the lectures, labs, and all other material will be available. However, the resources for the remote alternative to the labs are limited, and the remote option will only be available for students with a good justification (for example, enrolling from overseas). Students who can be in Wellington must participate in the face-to-face labs to develop the critical practical lab knowledge and skills for the course.

Students taking this course remotely must have access to a computer with camera and microphone and a reliable high speed internet connection that will support real-time video plus audio connections and screen sharing. Students must be able to use Zoom; other communication applications may also be used. A mobile phone connection only is not considered sufficient. The computer must be adequate to support any computer work required by the course: almost any modern windows, macintosh, or unix laptop or desktop computer will be sufficient, but an Android or IOS tablet will not.

If the assessment of the course includes tests, the tests will generally be run in-person on the Kelburn campus. There will be a remote option for students who cannot attend in-person and who have a strong justification (for example, being enrolled from overseas).

The remote test option will use Zoom for online supervision of the tests and you must be able to use Zoom with a camera, microphone, and screen-sharing. Students who will need to use the remote test option must contact the course coordinator in the first two weeks to get permission and make arrangements.

=====

Almost every modern electronic circuit contains some form of embedded controller, very often a microcontroller, although Programmable Gate Arrays and their variants are becoming more common especially when the problem is parallel in nature. The decreasing cost and increasing power of microcontrollers has led to their employment in a vast number of electronic devices. A significant advantage of microcontrollers is their ability to be configured using a common programming language (especially C), and hence functionality can be easily changed without requiring an expensive and time consuming hardware change.

Microcontrollers are taught in this course mainly through the laboratory section of the course. The course begins with very structured laboratory assignments. However you are expected to become more responsible for your own learning as the course progresses.

Withdrawal from Course

Withdrawal dates and process:

<https://www.wgtn.ac.nz/students/study/course-additions-withdrawals>

Lecturers

Robin Dykstra (Coordinator)

robin.dykstra@vuw.ac.nz +64 4 886 5334

415 Alan MacDiarmid Building, Kelburn

Hamish Colenso

hamish.colenso@vuw.ac.nz 04 463 6523

247 Cotton, Kelburn

Teaching Format

This course will be offered in-person and online. For students in Wellington, there will be in-person lectures and in-person labs. It will also be possible to take the course entirely online for those who cannot attend on campus, with all the components provided in-person also made available online.

During the trimester there will be two lectures per week. Some hours will be used for tutorials.

Student feedback

Student feedback on University courses may be found at: www.cad.vuw.ac.nz/feedback/feedback_display.php

Dates (trimester, teaching & break dates)

- Teaching: 05 July 2021 - 08 October 2021
- Break: 16 August 2021 - 29 August 2021
- Study period: 11 October 2021 - 14 October 2021
- Exam period: 15 October 2021 - 06 November 2021

Class Times and Room Numbers

05 July 2021 - 15 August 2021

- **Monday** 14:10 - 15:00 – 104, Alan MacDiarmid Building, Kelburn
- **Wednesday** 14:10 - 15:00 – 104, Alan MacDiarmid Building, Kelburn
- **Friday** 14:10 - 15:00 – 104, Alan MacDiarmid Building, Kelburn

30 August 2021 - 10 October 2021

- **Monday** 14:10 - 15:00 – 104, Alan MacDiarmid Building, Kelburn
- **Wednesday** 14:10 - 15:00 – 104, Alan MacDiarmid Building, Kelburn
- **Friday** 14:10 - 15:00 – 104, Alan MacDiarmid Building, Kelburn

Other Classes

Laboratory sessions will be scheduled in the first week of term and will begin in the second week. The laboratory sessions will be held in CO249 and are designed to be three hours duration.

Set Texts and Recommended Readings

Required

Students will be provided with a set of comprehensive notes. This set of notes covers all the material that will be covered in the lecture other than material that you will be required to independently research. A laboratory manual with the laboratory exercises is also provided as well as a user manual for the microcontrollers that you will be using.

Recommended

No textbook is required, however students may consider purchasing one of these texts as an additional source of information. In order of preference, some suggestions are:

- Bolton, W. "*Mechatronics*", 3rd edition.
- Alciatore, D and Hisand, M, "*Introduction to Mechatronics and Measurement Systems*" 2nd edition.
- Horowitz & Hill "*The Art of Electronics*", (a reference book for people who are seriously interested in electronics).
- Molloy, D. "*Exploring Beaglebone*"

Mandatory Course Requirements

In addition to achieving an overall pass mark of at least 50%, students must:

- Satisfactorily complete at least 80% of the assigned labs (a demonstrator must verify all lab work).
- Hand in at least 2 assignments.
- Score at least 40% on both the internal tests.

If you believe that exceptional circumstances may prevent you from meeting the mandatory course requirements, contact the Course Coordinator for advice as soon as possible.

Assessment

The course is entirely internally assessed (there is no formal examination), comprising 20% written assignments, 50% tests and 30% laboratory work, detailed below.

The three assignments will be issued at regular intervals: approximately weeks 6, 8 and 12. Two sides of hand-written A4 notes and approved calculators will be permitted in the tests.

Assessment Item	Due Date or Test Date	CLO(s)	Percentage
Term Test 1	Week 5	CLO: 1,2,3,4,5,6,7	25%
Term Test 2	Week 12	CLO: 1,2,3,4,5,6,7	25%
Three written assignments		CLO: 1,2,3,4,5,6,7	20%
Laboratory work, including the project, laboratory write-ups and laboratory practical marks.		CLO: 1,2,3,4,5,6,7	30%

Penalties

Late assessment will be penalised at the rate of 5% for every day the assessment is late. The lecturer may refuse to mark work that has been handed in over a week late, and may also refuse if the assessment has been marked and returned to the class. In such instances, a zero grade for that assessment shall result.

Extensions

Individual extensions will only be granted in exceptional personal circumstances, and should be negotiated with the course coordinator before the deadline whenever possible. Documentation (eg, medical certificate) may be required.

Submission & Return

Lab work is submitted through the ECS submission system, accessible through the course web pages. Marks and comments will be returned through the ECS marking system, also available through the course web pages.

Marking Criteria

There will be two tests designed to assess analytical skills and the knowledge base of students (objectives 2-8). These tests will examine the students' ability to make informed engineering design decisions, and your understanding of, and ability to apply, the material presented in the lectures.

The laboratory part of the course assessment is designed to test the students' ability to design and debug microprocessor code and circuits (objective 1), to maintain a reliable laboratory notebook, and to report in written form on their design work (objective 9).

Laboratory Reports

You are required to submit a formal laboratory report for each of the assigned labs. These should be of professional standard detailing the objective of the laboratory exercise, the methodology employed, a justification for any design decisions, results obtained and an analysis or evaluation of your results. You should answer any questions asked of you in the laboratory manual.

Note, there is a non-linear relationship between the write-up mark and your overall laboratory grade. For example, a mark of 8/10 for a write-up does not guarantee you an A grade for the laboratory work since several of these items are designated as mastery assessments. This will be further explained in the lectures.

Group Work

We encourage you to discuss the principles of the course and assignments with other students, to help and seek help with programming details, problems involving the lab equipment, etc. However, any work you hand in MUST be your own work.

Workload

The expectation is that you will do roughly 12 hours of work per week on average. This will normally comprise 2 hours of lectures, 1 hour tutorial, 3 – 4 hours of laboratory work, and an average of 3 – 4 hours of assignment work, laboratory write-ups, and background reading.

Teaching Plan

See blackboard for teaching plan.

Communication of Additional Information

Any additional information regarding this course will be posted on blackboard.
