COMP 103 : Test

2019, Sept 3

Instructions

- Time allowed: **50 minutes**
- Attempt **all** questions. There are 50 marks in total.
- Write your answers in this test paper and hand in all sheets.
- If you think some question is unclear, ask for clarification.
- Brief Java documentation is provided with the test
- This test contributes 18% of your final grade
(But your mark will be increased to your exam mark if that is higher.)
- You may use dictionaries.
- You may write notes and working on this paper, but make sure your answers are clear.

Questions

Marks

1. Properties of Collections	[12]	<input type="text"/>
2. Using Queues in Simulations	[13]	<input type="text"/>
3. Using Collections	[10]	<input type="text"/>
4. Cost of Algorithms	[7]	<input type="text"/>
5. Recursion	[8]	<input type="text"/>
	TOTAL:	<input type="text"/>

Cross out rough working that you do not want marked.
Specify the question number for work that you do want marked.

Question 1. Properties of Collections**[12 marks]**

For these questions, circle "true" or "false" for each property. (Note some properties may be true for more than one type.)

(a) **[4 marks]** For a Map, state whether each property is true or false.

true/false : The order of values in the collection is important
true/false : To remove a value, you must specify its key
true/false : The collection cannot contain any duplicate keys
true/false : The collection records the number of copies of each value

(b) **[4 marks]** For a Stack, state whether each property is true or false.

true/false : The order of items in the collection is important
true/false : Items must have a natural ordering to be stored in the collection.
true/false : The first item added is the last item to be removed
true/false : The collection can contain duplicate items

(c) **[4 marks]** For a List, state whether each property is true or false.

true/false : An item can be only be removed by specifying its index
true/false : The order of items in the collection can be changed
true/false : The collection cannot contain any duplicate items
true/false : The time an item is added does not affect when it is removed

Question 2. Using Queues in Simulations**[13 marks]**

For this question, you are to extend a simple simulation program.

The program simulates jobs in a factory being processed by a machine. The machine has a queue of Jobs waiting to be processed. On each time tick:

- a new Job may be created and added to the queue.
- the Job at the head of the queue is advanced one tick
- if the Job at the head of the queue is complete, it is removed from the queue.
- the queue is redisplayed.

You must extend the program for a factory with multiple machines, each with its own queue.

- There are five machines, named "Lathe", "Drill", "Cutter", "Sander", "Painter".
- Each Job contains a machine name; the Job should be added to the queue of the machine with that name. (The getMachineName() method returns the name.)
- On every time tick, the first job on every queue should be advanced.

Here is the one-machine program:

```

public class Simulation{
    private boolean running = false;

    private Queue<Job> queue;

    public void setup(){
        running = false;
        queue = new ArrayDeque<Job>();
    }

    public void run(){
        int time = 0;
        running = true;
        while (running){
            time++;
            if (Math.random()<0.2){
                Job j = new Job();
                queue.offer(j);
            }
            if (!queue.isEmpty()){
                Job topJob = queue.peek();
                topJob.advanceJobByOneTick();
                if (topJob.isCompleted()){
                    queue.poll();
                }
            }
            display(queue, 1); // redisplay queue on row 1 of the window
        }
    }
}

```

(Question 2 continued on next page)

(Question 2 continued)

Extended simulation with multiple machines, each with its own queue:

```
public class Simulation{
    public static final String[ ] MACHINE_NAMES =
        new String[ ]{"Lathe","Drill","Cutter","Sander","Painter"};
}
```

Question 3. Using Collections**[10 marks]**

Complete the following `countTwice` method which is given a List of words (Strings), and returns the number of words that occur exactly twice in the List.

The method should be efficient: if the List has n words, then the method should run in $O(n)$ time.

Hint: this is similar to finding the mode of a list of numbers.

```
public int countTwice(List<String> words){
```

```
}
```

Question 4. Cost of Algorithms**[7 marks]**

What is the big-O cost of the following method that prints all possible matches of tennis players from a list of players?

- write the big-O cost of performing each line with a comment
- write the number of times each of the lines will be performed,
- write the total cost of the algorithm (big-O) at the bottom of the box

```

public void findMatches( List<Player> players){
    Collections . sort ( players );           // cost = O(      ) times =
    for ( Player p1 : players ){
        for ( Player p2 : players ){
            if ( p1 != p2 ) {                 // cost = O(      ) times =
                Ul. println ( p1.name()+" : "+p2.name()); // cost = O(      ) times =
            }
        }
    }
    }
}
Total Cost = O(      )

```

Question 5. Recursion**[8 marks]**

(a) **[4 marks]** Complete the following recursive `drawCircles(x, y, diam)` method to draw a diagonal line of circles.

- You must use a “first-and-rest” recursion: `drawCircles` should draw the first circle and then call itself recursively to draw the rest of the circles.
- The first circle should be centered at (x,y) with diameter `diam`.
- The next circle should be `diam` pixels to the right and down from the first, and should be 5 pixels smaller.
- It should continue to draw circles as long as the diameter is larger than 3.

For example, `drawCircles(100, 100, 30)` should output the following:

```
public void drawCircles(double x, double y, double diam){
```

```
}
```

Hint: you can use the method `UI.drawOval(left, top, diam, diam)` to draw a circle.

(Question 5 continued)

(b) [4 marks] Suppose the variable letters contains the following List of 6 Strings:

"A"	"B"	"C"	"D"	"E"	"F"
0	1	2	3	4	5

What will mixUp(letters, 0, 5) print out?

```

/** mix up the letters in the list */
public void mixup(List<String> letters, int start, int end){
    if ( start <= end) {
        int mid = start + (end-start)/3;
        Ul.print( letters .get(mid));
        mixup( letters , mid+1, end);
        mixup( letters , start , mid-1);
    }
}

```

Answer:

Documentation

Brief, simplified specifications of some relevant Java collection types and classes.

Note: E stands for the type of the item in the collection.

interface *Collection* <E>

```
public boolean isEmpty()           // cost: O(1) for all standard collection classes
public int size()                 // cost: O(1) for all standard collection classes
public void clear()
public boolean add(E item)
public boolean contains(Object item)
public boolean remove(Object element)
```

interface *List* <E> **extends** *Collection* <E>

// Implementations: ArrayList

```
public boolean isEmpty()
public int size()
public void clear()
public E get(int index)           // cost: O(1)
public E set(int index, E element) // cost: O(1)
public boolean contains(Object item) // cost: O(n)
public void add(int index, E element) // cost: O(n) (unless index is close to the end.)
public E remove(int index)       // cost: O(n) (unless index is close to the end.)
public boolean remove(Object element) // cost: O(n)
```

interface *Set* **extends** *Collection* <E>

// Implementations: HashSet, TreeSet

```
public boolean isEmpty()
public int size()
public void clear()
public boolean add(E item)       // cost: O(1) for HashSet, O(log(n)) for TreeSet
public boolean contains(Object item) // cost: O(1) for HashSet, O(log(n)) for TreeSet
public boolean remove(Object element) // cost: O(1) for HashSet, O(log(n)) for TreeSet
```

interface *Map* <K, V>

// Implementations: HashMap, TreeMap

```
public V get(K key)              // cost: O(1) for HashMap, O(log(n)) for TreeMap
public V put(K key, V value)    // cost: O(1) for HashMap, O(log(n)) for TreeMap
public V remove(K key)         // cost: O(1) for HashMap, O(log(n)) for TreeMap
public boolean containsKey(K key) // cost: O(1) for HashMap, O(log(n)) for TreeMap
public Set<K> keySet()          // cost: O(1)
public Collection<V> values()   // cost: O(1)
// (get returns null if the key is not present)
// (get put and remove return the old value, if any)
```

```
interface Queue<E> extends Collection<E>
    // Implementations: ArrayDeque, LinkedList, PriorityQueue
    public boolean isEmpty()
    public int size()
    public void clear()
    public E peek () // cost: O(1) for ArrayDeque, LinkedList, O(1) for PriorityQueue
    public E poll () // cost: O(1) for ArrayDeque, LinkedList, O(log(n)) for PriorityQueue
    public boolean offer (E element) // cost: O(1) for ArrayDeque, LinkedList, O(log(n)) for PriorityQueue
    // (peek and poll return null if the queue is empty)
```

```
class Stack<E> implements Collection<E>
    public boolean isEmpty()
    public int size()
    public void clear()
    public E peek () // cost: O(1)
    public E pop () // cost: O(1)
    public E push (E element) // cost: O(1)
    // (peek and pop return null if the queue is empty)
```

```
class Collections
    public void sort (List<E> list); // cost = O(n log(n)), but O(n) if almost sorted
    public void sort (List<E> list, (E e1, E e2) -> {...}); // cost = O(n log(n)), but O(n) if almost sorted
    public void swap (List<E> list, int i, int j); // cost = O(1)
    public void reverse (List<E> list); // cost = O(n)
    public void shuffle (List<E> list); // cost = O(n)
```

```
interface Comparable<E> // All Comparable objects have a compareTo method:
    public int compareTo(E other);
        // returns
        // -ve if this comes before other;
        // +ve if this comes after other,
        // 0 if this and other are the same
```
